			ART UNIT	PAPER NUMBER
			2816	

DATE MAILED: 09/13/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

<p align="center"><b>Office Action Summary</b></p>	<b>Application No.</b> 10/626,735	<b>Applicant(s)</b> FORBES, LEONARD	
	<b>Examiner</b> Quan Tra	<b>Art Unit</b> 2816	

**-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --**

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 7/24/06.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 67-82,86-89 and 92-98 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 67-82,86-89 and 92-98 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
 Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
 Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some    \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## **DETAILED ACTION**

### ***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 7/24/06 has been entered. A new ground of rejection is introduced.

### ***Claim Rejections - 35 USC § 103***

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 67-82, 86-89 and 98 are rejected under 35 U.S.C. 103(a) as being unpatentable over Applicant admitted prior art in USP 6377084 in view of Muto (JP 11-026593), newly cited and Mirov (USP 6008682), newly cited.

As to claim 87, the prior art figure 2 in USP 6377084 shows a signal transmission system comprising: a first transmission member (I1) having a first length, the first transmission member including a transmission medium (inherent); a second transmission member (I2) having a second length, the second transmission member including the transmission medium (inherent); a signal receiver (the differential amplifier) having first and second signal inputs coupled to the first and second transmission members respectively; first and second signal generators (the transistors that generate Isignals) coupled to the first and second transmission members respectively. Thus, figure 2 shows all limitations of the claim except for "an

Art Unit: 2816

impedance adjusting component coupled to the second transmission member". However, Muto's figure 2 shows a signal transmission system having an impedance adjusting component ((7, 11, 15) or 8, 12, 16)) coupled to the second transmission member (3 or 4) in order to reduce signal skew generated by first and second drivers INV1 and INV3. Therefore, it would have been obvious to one having ordinary skill in the art to add impedance adjusting component to at least one of the transmission member in the prior art figure 2 of USP 6377084 for the purpose of reducing signal skew. The prior art further fails to shows termination circuit connected to at least one of the transmission members. However, Mirov's figure 5 shows termination circuits R5 and R6 respectively connected the transmission members T1 and T2 in order to eliminate reflection. Therefore, it would have been obvious to one having ordinary skill in the art to add termination circuit for each of the prior art's transmission members for the purpose of eliminating signal reflection, thereby saving power consumption. The modified prior figure 2 in USP 6377084 further fails to teach that the impedance of the transmission member is less than 100 ohms. However, it is notoriously well known in the art that the impedance of the transmission member is proportional to the power consumption. Further, Mirov teaches that the impedances of transmission members T1 and T2 are less than 100 Ohms. Therefore, it would have obvious to one having ordinary skill in the art to use a less than 100 Ohms transmission line for each of the prior art's transmission member for the purpose of saving power consumption.

Claim 67 recites similar limitations of claim 87. Therefore, it is rejected for the same reasons.

As to claim 68, the modified Applicant's prior art figure 2 shows all limitations of the claim except the impedance adjusting component comprises: an electrical inductor. However, it is notoriously well known in the art that the impedance of parallel connected capacitor is equal to the impedance of serial connected inductor (impedance of capacitor is  $1/j\omega C$ , and impedance of

Art Unit: 2816

inductor is  $j\omega L$ ). Therefore, it would have been obvious to one having ordinary skill in the art to use series connected inductors for the impedance adjusting component due to doctrine equivalent function.

As to claim 69, the modified Applicant's prior art figure 2 fails to show the electrical inductor comprises a spiral inductor. However, it is well known in the art that spiral inductor is used in high speed environment. Therefore, it would have been obvious to one having ordinary skill in the art to use spiral inductors for the impedance adjusting component for the purpose of operating in a high speed environment.

As to claim 70, the modified Applicant's prior art figure 2 shows impedance adjusting component comprises: a material (the newly added inductors) having; a magnetic permeability, the material adapted to be incorporated into the second transmission member.

As to claim 71, Nishimura et al.'s figure 5 shows the impedance adjusting component comprises: an electrical capacitor (C12).

As to claim 72, the modified Applicant's prior art figure 2 shows the relationship established between respective transmission times that comprises equalization of the respective transmission times.

As to claim 73, the modified Applicant's prior art figure 2 shows the first length is different from the second length and the respective transmission times through the respective first and second transmission members are equal.

As to claim 74, it is inherent that the transmission medium comprises an electrical transmission medium.

As to claim 75, the modified Applicant's prior art figure 2 shows the electrical transmission medium comprises a first conductor, a second conductor, and a dielectric material (inherent) disposed between the first conductor and the second conductor.

Art Unit: 2816

As to claim 76, the modified Applicant's prior art figure 2 shows the electrical transmission medium comprises a first conductor; a second conductor; and an evacuated region (inherent) disposed between the first conductor and the second conductor.

As to claim 77, the modified Applicant's prior art figure 2 shows the electrical transmission medium comprises first and second conductors disposed in a coaxial relationship to one another and a dialectic medium disposed between the first and second conductors.

As to claim 78, the modified Applicant prior art figure 2 fails to shows that the medium is optical medium. However, it is seen as an intended use for using the modified prior art figure 2 in optical medium because the modified prior art figure 2 capable of operating in optical medium

As to claim 79, the modified Applicant's prior art figure 2 fails to shows the capacitor C12 comprises a plurality of capacitors. However, it is notoriously well known in the art that a capacitor can be made by plurality of small capacitor connected in parallel ( $C_{total} = C_1 + C_2 + \dots C_n$ ). Therefore, it would have been obvious to one having ordinary skill in the art to use plurality of parallel capacitors for Nishimura et al.'s capacitor 12 in order to meet a desired capacitance.

As to claim 80, Applicant's prior art figure 2 shows the first and-second signals comprise first and second digital signals.

As to claim 81, Applicant's prior art figure 2 shows first and second signal receivers (T1, T3 and T5; T2, T4 and T6) coupled to the first and second transmission members at respective first and second signal inputs.

As to claim 82, the modified Applicant's prior art figure 2 shows the first input has an input impedance substantially equal to a characteristic impedance of the first transmission member (because of the newly added termination circuits) and the second input has an input

impedance substantially equal to a characteristic impedance of the second transmission member.

As to claim 86, the prior art figure 2 shows that the first receiver (T1, T3, T5) comprises a first input (note 5) adapted to be coupled to the first transmission member and a second input (gates of T1 and T3) adapted to be coupled to a reference signal.

Claims 88 and 89 recite similar limitations of claim 87. Therefore, they are rejected for the same reasons.

As to claim 98, the modified prior art figure 2 shows the termination circuit terminates at least a first characteristic impedance of the first transmission member and the second characteristic impedance of the second transmission member.

3. Claims 92-97 are rejected under 35 U.S.C. 103(a) as being unpatentable over Muto (JP 11-026593) in view of Mirov (USP 6008682).

As to claim 92, Muto's figure 2 shows a method of synchronizing first and second operations of respective first and second circuits (2, 17) comprising: receiving a first signal (output of INV1) transition at the first circuit through a first transmission member (3), the first transmission member having a first signal propagation factor and a first geometric length, the first signal propagation factor related to a first characteristic impedance of the first transmission member; receiving a second signal (output of INV3) transition at the second circuit through a second transmission member (4), the second transmission member having a second signal propagation factor and a second geometric length, the second signal propagation factor related to a second characteristic impedance of the second transition member, the second geometric length different from the first genetic length; and receiving the first and second signal transitions at the first and second transmission members synchronously. Thus, figure 5 shows all limitations of the claim except for the step of "terminating the first characteristic impedance of

Art Unit: 2816

the first transmission member and the second characteristic impedance of the second transmission member". However, Muto's figure 5 shows a termination circuits (R5, R6) coupled to lines T1 and T2 for reducing the signal reflection. Therefore, it would have been obvious to one having ordinary skill in the art to add termination circuit for each of the clock lines in Muto's figure 2 for the purpose of eliminating signal reflection, thereby saving power consumption. Muto fails to show that the impedances of the transmission members are less than 100 Ohms. However, it is notoriously well known in the art that the impedance of the transmission member is proportional to the power consumption. Further, Mirov teaches that the impedances of transmission lines are less than 100 Ohms. Therefore, it would have obvious to one having ordinary skill in the art to use a less than 100 Ohms transmission line for each of the Muto's transmission members for the purpose of saving power consumption.

As to claim 93, Muto's figure 2 shows the receiving the first and second signal transitions at the first and second transmission members synchronously comprises receiving the first and second signal transitions at the first and second transmission members substantially simultaneously.

As to claim 94, Muto's figure 2 shows the second characteristic impedance depends on an impedance of at least one impedance (of the capacitors) modifying component coupled to the second transmission member.

As to claim 95, the modified Muto's figure 2 fails to shows the impedance modifying component comprises a spiral inductor. However, it is notoriously well known in the art that the impedance of parallel connected capacitor is equal to the impedance of serial connected inductor (impedance of capacitor is  $1/j\omega C$ , and impedance of inductor is  $j\omega L$ ). Therefore, it would have been obvious to one having ordinary skill in the art to use series connected inductors for the impedance adjusting component due to doctrine equivalent function. It is also

Art Unit: 2816

well known in the art that spiral inductor is used in high speed environment. Therefore, it would have been obvious to one having ordinary skill in the art to use spiral inductors for the impedance adjusting component for the purpose of operating in a high speed environment.

As to claim 96, figure 5 shows the impedance modifying component comprises a capacitor.

As to claim 97, figure 5 shows the second characteristic impedance depends on a magnetic permeability of a material incorporated into the second transmission member (it is inherent the transmission lines have parasitic inductance).

### ***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Quan Tra whose telephone number is 571-272-1755. The examiner can normally be reached on 8:00 AM - 5:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Timothy Callahan can be reached on 571-272-1740. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
